Formal Modeling of IoT Smart Spaces

Outline
In IoT Smart Spaces software is interacting with humans. Security becomes important from different perspectives, including:

- PRIVACY, to protect the dissemination of data a Smart Space inherently collects.
- SAFETY, to protect users from their autonomous mowers, workers from their robot colleagues, etc.
- SECURITY, to protect unwanted intrusion to the physical Smart Spaces.

An important tool for providing security is verification. It requires a formal modeling of an IoT Smart Space. I did diverse preliminary work into that direction already and would like to take this approach to the next level with you...

Possible Structure
- Analysis
  - Technology review
  - Review of service modeling and verification patterns
- Related work
  - What do other projects do that answer related questions?
- Design
  - Which components do you need?
  - Security, dependability, scalability, ...
  - Which are options for the design? Why are your choices good?
- Implementation
  - Frameworks used, screenshots, etc.
- Evaluation
  - How well does it work?
    - Metrics!

Requirements
Curiosity, Joy to work in a team, Knowledge in Java.
Ability to write good code (including unit tests and documentation).
